Our team (AHA Moments) will develop a modern website that showcases an imaginary hotel's features, services, and pricing. In this project, we will create a hotel website that portrays a beautiful image through videos and pictures from the hotel. Moreover, we want to illustrate what kind of experiences visitors would have when they stay at the hotel, which is the underlying factor in the hotel's originality. We will include the essential information that travelers will be looking for (such as hotel location, contact information, and the link to our booking page). Still, the website should be engaging and provide the users with a satisfactory experience.

The user can check the available rooms on the index page by defining the dates, and we will redirect them to the booking page to show available options. In the next section, we provide the user with the possibility of purchasing gift cards. Also, there will be a gallery section on this page to show the media of various parts of the hotel. The last part of this page will be "about us," where we describe the hotel's journey.

The next page will be "contact us," The user can reach out to the support team, ask questions and discuss possible inquiries.

The user can use filters such as dates to find their perfect room and reserve the room on the booking page if they like.

The services page will have information about the different options for services that the hotel provides for the duration of stay that they can reserve.

The visitors can sign in and check their previous reservations and purchases.

The website will include the following page:

- ✓ *Home*
- ✓ *Contact us*
- ✓ *Room booking*
- ✓ *Services*
- ✓ *Sign in/Sign up (as a pop-up page)*

There will be sub-pages for the above main pages:

- *Home*
 - *Check room availability*

AHA Moments

- *Gift Cards*
- *Gallery*
- *About us*
- *Contact us*
- *Booking*
- *Services*
 - *Spa*
 - *Food*
 - *Parking*
- *Sign in/Sign up*
 - *Purchases*
 - *History*

We will design straightforward navigation to make it easy for visitors to find the information they need and lead customers along a smooth path to booking. This involves organizing content with customers in mind and making sure critical information such as rooms and rates, amenities, contact details, and online bookings are easily accessible. High-quality images and slideshow photo galleries will illustrate the hotel to attract more customers.

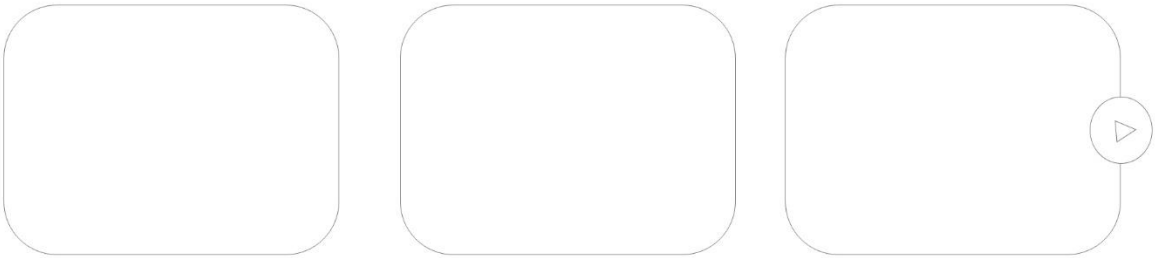

We will use JavaScript language to implement some features, such as a date picker for the reservation page. We will develop the back-end side using the PHP language using the techniques we learned, such as user authentication, communicating with the database, and OOP. MySQL technology will be used for the database as its relational nature is well aligned with our needs in this project. Moreover, HTML and CSS will be used with their libraries.
